Graphs: Basic Terminology

Graphs: Basic Terminology

- Two vertices, say u and v , are called **adjacent** (or **neighbours**) if (u, v) or (v, u) is an edge.

Graphs: Basic Terminology

- Two vertices, say u and v , are called **adjacent** (or **neighbours**) if (u, v) or (v, u) is an edge.

Graphs: Basic Terminology

- Two vertices, say u and v , are called **adjacent** (or **neighbours**) if (u, v) or (v, u) is an edge.

1 and 3 are adjacent

Graphs: Basic Terminology

- Two vertices, say u and v , are called **adjacent** (or **neighbours**) if (u, v) or (v, u) is an edge.
- Vertices u and v are said to be **incident** on an edge e , if $e = (u, v)$ or $e = (v, u)$.

Graphs: Basic Terminology

- Two vertices, say u and v , are called **adjacent** (or **neighbours**) if (u, v) or (v, u) is an edge.
- Vertices u and v are said to be **incident** on an edge e , if $e = (u, v)$ or $e = (v, u)$.

4 is incident on
(4,1), (6,4) edges

Graphs: Basic Terminology

- Two vertices, say u and v , are called **adjacent** (or **neighbours**) if (u, v) or (v, u) is an edge.
- Vertices u and v are said to be **incident** on an edge e , if $e = (u, v)$ or $e = (v, u)$.

- The **degree** of a vertex is the number of edges it is incident with.

Graphs: Basic Terminology

- Two vertices, say u and v , are called **adjacent** (or **neighbours**) if (u, v) or (v, u) is an edge.
- Vertices u and v are said to be **incident** on an edge e , if $e = (u, v)$ or $e = (v, u)$.

degree(1) = 3

- The **degree** of a vertex is the number of edges it is incident with.

Graphs: Basic Terminology

- Two vertices, say u and v , are called **adjacent** (or **neighbours**) if (u, v) or (v, u) is an edge.
- Vertices u and v are said to be **incident** on an edge e , if $e = (u, v)$ or $e = (v, u)$.

- The **degree** of a vertex is the number of edges it is incident with.
- A **path** from a vertex u to a vertex v is a sequence of vertices $\langle v_0, v_1, v_2, \dots, v_k \rangle$ such that

Graphs: Basic Terminology

- Two vertices, say u and v , are called **adjacent** (or **neighbours**) if (u, v) or (v, u) is an edge.
- Vertices u and v are said to be **incident** on an edge e , if $e = (u, v)$ or $e = (v, u)$.

- The **degree** of a vertex is the number of edges it is incident with.
- A **path** from a vertex u to a vertex v is a sequence of vertices $\langle v_0, v_1, v_2, \dots, v_k \rangle$ such that $v_0 = u$, $v_k = v$, (v_{i-1}, v_i) is an edge and **no vertex is repeated** in the sequence.

Graphs: Basic Terminology

- Two vertices, say u and v , are called **adjacent** (or **neighbours**) if (u, v) or (v, u) is an edge.
- Vertices u and v are said to be **incident** on an edge e , if $e = (u, v)$ or $e = (v, u)$.

$\langle 5, 7, 1, 3, 6 \rangle$ is a path

- The **degree** of a vertex is the number of edges it is incident with.
- A **path** from a vertex u to a vertex v is a sequence of vertices $\langle v_0, v_1, v_2, \dots, v_k \rangle$ such that $v_0 = u$, $v_k = v$, (v_{i-1}, v_i) is an edge and **no vertex is repeated** in the sequence.

Graphs: Basic Terminology

- The **length** of a path is the **number of edges** in it.

Graphs: Basic Terminology

- The **length** of a path is the **number of edges** in it.

Graphs: Basic Terminology

- The **length** of a path is the **number of edges** in it.

$\langle 5, 7, 1, 3, 6 \rangle$ is a path of length 4

Graphs: Basic Terminology

- The **length** of a path is the **number of edges** in it. The **distance** from a vertex i to a vertex j is the **length of the shortest path** from i to j .

Graphs: Basic Terminology

- The **length** of a path is the **number of edges** in it. The **distance** from a vertex i to a vertex j is the **length of the shortest path** from i to j .

Distance from 6 to 1 is 2

Graphs: Basic Terminology

- The **length** of a path is the **number of edges** in it. The **distance** from a vertex i to a vertex j is the **length of the shortest path** from i to j .

- A **cycle** is a sequence of vertices $\langle v_0, v_1, v_2, \dots, v_k \rangle$ such that $v_0 = v_k$, (v_{i-1}, v_i) is an edge and

Graphs: Basic Terminology

- The **length** of a path is the **number of edges** in it. The **distance** from a vertex i to a vertex j is the **length of the shortest path** from i to j .

- A **cycle** is a sequence of vertices $\langle v_0, v_1, v_2, \dots, v_k \rangle$ such that $v_0 = v_k$, (v_{i-1}, v_i) is an edge and **no vertex** apart from v_0 and v_k is **repeated** in the sequence.

Graphs: Basic Terminology

- The **length** of a path is the **number of edges** in it. The **distance** from a vertex i to a vertex j is the **length of the shortest path** from i to j .

$\langle 4, 1, 3, 6, 4 \rangle$ is a cycle

- A **cycle** is a sequence of vertices $\langle v_0, v_1, v_2, \dots, v_k \rangle$ such that $v_0 = v_k$, (v_{i-1}, v_i) is an edge and **no vertex** apart from v_0 and v_k is **repeated** in the sequence.

The **adjacency-matrix representation** of a graph $G = (V, E)$ assumes that the vertices are numbered **1, 2, ..., $|V|$** in an arbitrary manner. Then, the adjacency matrix representation of a graph G consists of a $|V| \times |V|$ **matrix A** such that **$A[i][j] = 1$** , if **$(i, j) \in E$** , else **$A[i][j] = 0$** .

Graphs: Representation

Adjacency-matrix representation:

G 's adjacency matrix

| | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|---|---|---|---|---|---|---|---|
| 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| 2 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| 6 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| 7 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |

The **adjacency-matrix representation** of a graph $G = (V, E)$ assumes that the vertices are numbered $1, 2, \dots, |V|$ in an arbitrary manner. Then, the adjacency matrix representation of a graph G consists of a $|V| \times |V|$ **matrix** A such that $A[i][j] = 1$, if $(i, j) \in E$, else $A[i][j] = 0$.

Note: In case of undirected graphs, for an edge (i, j) , $Adj[i][j] = Adj[j][i]$.

Some observations on [adjacency-list](#) and [adjacency-matrix](#) representation:

Graphs: Representation

Some observations on **adjacency-list** and **adjacency-matrix** representation:

- Adjacency-list requires $\Theta(|V| + |E|)$ space and adjacency-matrix representation requires $\Theta(|V|^2)$ space.

Graphs: Representation

Some observations on **adjacency-list** and **adjacency-matrix** representation:

- Adjacency-list requires $\Theta(|V| + |E|)$ space and adjacency-matrix representation requires $\Theta(|V|^2)$ space.
- Adjacency-list is preferred when you need to go over **all** the neighbours of a vertex.

Graphs: Representation

Some observations on **adjacency-list** and **adjacency-matrix** representation:

- Adjacency-list requires $\Theta(|V| + |E|)$ space and adjacency-matrix representation requires $\Theta(|V|^2)$ space.
- Adjacency-list is preferred when you need to go over **all** the neighbours of a vertex.
- Adjacency-matrix is preferred when you need to **quickly** determine the existence of an edge between two vertices *i* and *j*.

Graphs: Representation

Some observations on **adjacency-list** and **adjacency-matrix** representation:

- Adjacency-list requires $\Theta(|V| + |E|)$ space and adjacency-matrix representation requires $\Theta(|V|^2)$ space.
- Adjacency-list is preferred when you need to go over **all** the neighbours of a vertex.
- Adjacency-matrix is preferred when you need to **quickly** determine the existence of an edge between two vertices *i* and *j*.
- In adjacency-list of a directed graph, sum of size of all the lists = $|E|$.

Graphs: Representation

Some observations on **adjacency-list** and **adjacency-matrix** representation:

- Adjacency-list requires $\Theta(|V| + |E|)$ space and adjacency-matrix representation requires $\Theta(|V|^2)$ space.
- Adjacency-list is preferred when you need to go over **all** the neighbours of a vertex.
- Adjacency-matrix is preferred when you need to **quickly** determine the existence of an edge between two vertices i and j .
- In adjacency-list of a directed graph, sum of size of all the lists = $|E|$.
- If A is an adjacency-matrix of an undirected graph, then $A = A^T$.
